THE BEAUTY ALLEY

User Acceptance Test Script

Pilot acceptance pass · salon staff and owner · 30 test cases

What this is. A scripted acceptance pass over the pilot system. Every case is something the salon will actually do on opening day, written so a non-developer can run it and mark it pass or fail.

Environment. Pilot: `https://beautyalleyibms.vercel.app` (site + API on one origin). Console: the same host under `/app`.

Before you start

1. Open `https://beautyalleyibms.vercel.app/health` — it must return `200` with `"database":"ok"`. If not, stop and report; nothing below will work.
2. Have one browser window for the guest flow (signed out, or a private window) and one for the console.
3. Passwords are issued separately — never write them into this document.
4. Where a case creates data, put **UAT** plus your initials in the guest name (e.g. `UAT-JD`) so the rows are easy to find afterwards.

Accounts

Role	Email	Lands on
Administrator	admin@beautyalley.ph	`/app` (business summary)
Concierge	concierge@beautyalley.ph	`/app` (desk summary)
Employee (stylist)	stylist@beautyalley.ph	`/app` (own chair)
Client	client@beautyalley.ph	`/app/my-bookings`

Recording results. Mark **P** (pass), **F** (fail) or **N/A**. A fail needs the step number, what you saw, and a screenshot. Do not retry a failed write more than twice — a repeated write can look like a duplicate booking.

A. Public site — the guest

ID	Do this	Expect
TC-01	Open `/`	Landing page renders; header is Home / Scan & Check In / Services; the two main buttons lead to `/services` and `/book`. No "open console" link anywhere, no staff sign-in in the nav or footer.
TC-02	Open `/services`	Treatments listed with price and duration, grouped by category (Haircut & Salon Services, IV Drips, Beauty Shots, Add-ons). Every treatment shown here is also selectable on `/book`.
TC-03	Open `/book`, pick a treatment	Date chips appear; choosing a day shows only times the salon can actually serve — no time that is outside opening hours or already full. Changing the treatment resets the chosen time.
TC-04	Complete a booking as a guest: name + phone, pick a time, submit	Confirmation with a pass: booking code, treatment, date and time, stylist name, QR code. The phone field refuses obvious junk (fewer than 7 digits, letters).

ID	Do this	Expect
TC-05	Open the pass URL in a private window (not signed in)	The pass loads — a guest has no account, so the link itself is the access. Change one character in the URL and it must show "not found", not someone else's booking.
TC-06	Open `/login`, enter a valid email with a wrong password	A plain "email or password is incorrect" message; the email stays filled in. Five wrong attempts on the same account locks it for a while and the message says how many minutes. **Only test the lockout on a throwaway account** — do not lock the demo logins.

B. Sign-in and access control

ID	Do this	Expect
TC-07	Sign in as each of the four accounts	Administrator and Concierge land on the overview; Employee lands on the overview showing their own day; Client lands on **My bookings**.
TC-08	As the Client, type `/app/promos` in the address bar	A polite "you do not have access" screen with a way back — not a blank page, not a crash. Repeat for `/app/team` and `/app/clients`.
TC-09	Sign out, then open `/app/bookings` directly	You are sent to `/login`; after signing in you land back on the page you asked for.

C. Desk booking — the counter

ID	Do this	Expect
TC-10	Sign in as **Concierge** → `/app/bookings/new`	Three steps: treatment (searchable), when (day + time), who (client search or walk-in guest). The whole day's availability is visible at a glance, not one stylist at a time.
TC-11	Pick a treatment and a time, then look at the **Stylist** list	Only stylists who (a) are active, (b) perform that treatment, and (c) are free at that exact time. Change the time — the list changes with it. Nobody free shows "nobody is free at that time", never a stale name.
TC-12	Book for an existing client: search by name, phone or email	The client's record is selected (name shown in the summary), no guest fields required. Confirming issues the pass immediately — no payment step.
TC-13	Book a walk-in: skip the client search, enter guest name + phone	Same result; the booking is created against the guest details and the pass is ready to print.
TC-14	Enter a valid promo code in the summary	The discount appears in the summary before confirming. An unknown or expired code is refused with a readable reason, not a silent no-op.
TC-15	**New stylist check.** In Team (as Administrator) create a stylist who performs the treatment you are testing, give them working hours, then return to `/app/bookings/new` and refresh	The new stylist appears in the Stylist list for days they are rostered. Clear their working hours and they disappear from the list — no code change, no deploy.
TC-16	Try to book the same stylist at a time they are already booked	The booking is refused with a clear "already booked" message; the existing booking is untouched.
TC-17	Open `/app/bookings`	The run sheet lists the bookings you just created. Concierge and Administrator see the whole branch; an Employee sees only their own chair.

D. Arrival and check-in

ID	Do this	Expect
TC-18	Sign in as **Concierge** → `/app/scan-arrivals`, paste a pass token (`BA1.…`)	The guest and their booking are shown for confirmation. **Nothing is written yet.** Press *Confirm arrival* and the booking moves to arrived/checked in.
TC-19	Scan the same pass a second time	It is refused as already used. A forged or truncated token is refused as invalid — no booking is marked.
TC-20	Sign in as **Employee** → `/app/check-in`	The stylist can record arrival on their own booking. A booking that is not theirs is not offered.

E. Administration

ID	Do this	Expect
TC-21	As **Administrator** → `/app/services`, add a treatment (name, price, duration, category)	It appears on `/services` and in `/book` straight away, in the right category. **Retire** it and it disappears from booking, while past bookings still show the name they were sold under.
TC-22	`/app/team`, add an employee with a role and the treatments they perform	The employee appears in the list. No working hours yet — they are not bookable until a rota is set (see TC-15).
TC-23	`/app/promos` as Concierge: propose a code. Then as Administrator, open `/app/promos`	The Administrator sees a pending queue first. Approve → the code becomes live and works in TC-14. Reject with a reason → the row shows REJECTED and the reason, and the code never works.
TC-24	`/app/clients`	Each client shows bookings, lifetime value and last visit. Export the CSV — the numbers match the screen exactly. Deactivate a client: they leave the active list but their history is kept.
TC-25	`/app/board`	Tiles show live numbers (not fixtures). Drag a tile to a new position, reload the page — the arrangement is remembered on that device.

F. Floor and client

ID	Do this	Expect
TC-26	As Concierge, create a task in `/app/tasks` assigned to the stylist. Then sign in as the Employee → `/app/my-tasks`	The task is there. Move it to in-progress/done — the desk's board shows the same status, and the stylist cannot see a colleague's task.
TC-27	As Employee → `/app/attendance`	Time in and time out are recorded against the real clock; hours are computed. There is no invented "late" verdict and no row for a day nobody clocked in.
TC-28	As Client → `/app/my-bookings`	Only that client's own appointments, each with a link to its pass. An account with no bookings shows an empty state, not an error.

G. Data safety — the regression that started this pass

ID	Do this	Expect
TC-29	Create a booking, a client and an employee. Wait 10 minutes, reload, then ask for a redeploy of the same commit	**All three still exist.** Nothing on deploy, startup or health-check path reseeds, restores or truncates.

ID	Do this	Expect
TC-30	(Technical, on a development machine only) Run `npm run db:seed` with `NODE_ENV=production`	It refuses and says why. Same for `db:restore` and `reset-demo-data`. A destructive command must never run silently against the pilot database.
